Praxis-Kalibrierung der neuen mobilen Grossversuchsanlage MLS10 für beschleunigte Verkehrslastsimulation auf Strassenbelägen in der Schweiz-ASTRA 2007/011

Conclusions

M.N. Partl: TRB 2010 AFD40(2)

- After total 1.6 mio passings from June - November, the motorway pavement turned out to be very **stiff and of high bearing capacity** (evaluation ongoing)
- Compared to the **old untrafficked equivalent** Hinwil pavement that failed after ca 500'000 passings this pavement was superior. It was **new and designed & built** according to modern standards

 Empa, Swiss Federal Laboratories for Materials Testing and Research, Dübendorf, Switzerland

ABSTRACT
 Specific quantification of PM₁₀ emissions due to abrasion and resuspension from road pavement is not easily obtained from field studies because a large part of the total PM₁₀ concentration is attributed to other local PM sources. It is extremely difficult to quantitatively attribute the measured PM₁₀ to the individual sources. In this study emission rates were derived from measurement with two road simulators of different size on two types of road pavement (asphalt concrete, porous asphalt). The experimental set-up allows for a separate characterization of the contribution of fresh in-situ abrasion and resuspension of previously deposited dust. The results show an important contribution of resuspension to the fine particle emissions of road traffic. Direct abrasion from the road surface is of minor importance for intact pavements. Resuspension of pavement surfaces can cause significant fine particle emissions.

Moisture damage on bituminous stabilized materials using the MIST device

M. E. Twagira & K. J. Jenkins Univ of Stellenbosch

- **MMLS3** used for validation of moisture induction simulation test (*MIST*) to assess **moisture-induced damage** –ravelling. MIST is based upon cyclic pulsing of water, at pressure, into a triaxial specimen.
- Aggregate blends with/without RAP, different bitumen **binder types** and additional active **fillers** were investigated.
- Found that **MIST** device has potential for use as a tool to condition bit stab specimens.

MMLS3 Research in SA

Evaluate **skid resistance, macro texture & colour retention** of coloured high friction course surfacings (HFCS)

PD Naidoo and Prof Kim Jenkins

- Testing of similar surfacings at 2 **bus terminals** under real actual bus wheels (field testing)
- MMLS trafficking performance using two test conditions.
 - **dry-wet** cycle for 100 000 load Reps.
 - dry trafficking at 53°C for 500 000 load Reps.
- **MMLS helped in all three evaluations**
