

# Extending Full Depth Reclamation (FDR) Service Lives

*2025 APT Monthly Webinar*

Eugene A. Amarh  
Bilin Tong  
Gerardo W. Flintsch  
Samer W. Katicha

Brian K. Diefenderfer  
Harikrishnan Nair

*October 09, 2025*

- **Overview of VA APT-Program**
- **Extending FDR Service Lives**
  - Background
  - Experimental Design
  - Laboratory and Field Activities
  - Results
    - *mix design, pavement responses, forensics*
- **Study Conclusions**

# Virginia APT Program

## ■ Facility Location

HVS model Mark VI

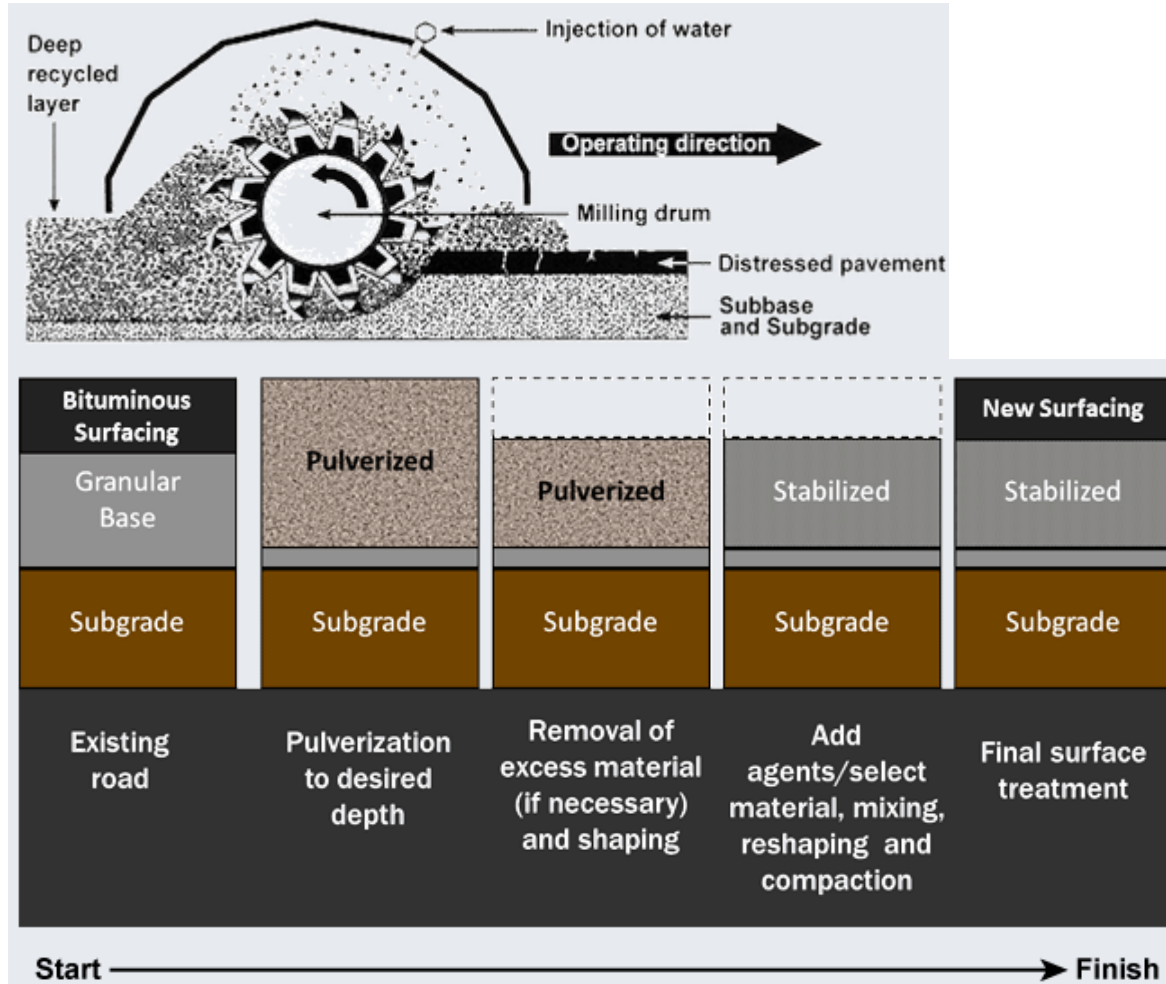

## ■ Overview of Experiments

#	Dates	Research Topic	Status
1	2015-2016	CCPR with Thin Surfacing	Completed
2	2016	Reduced Gyration Levels	Completed
3	2016-2018	Reflection Cracking Mitigation	Completed
4	2019-2023	Balanced Mix Design of Dense Graded Surface Mixtures	Completed
5	<b>2023-2025</b>	<b>Extending FDR Service Lives</b>	<b>Completed</b>
6	2024-2026	Thick Lift Paving	Ongoing

## Conventional FDR Process

- Since **2008** demo projects
- Over **600 lane-miles** in VA
- **Cement-stabilized** FDR
- **Interstates**, primary and secondary roads.
- **I-81 and I-64 projects**

## Problem Statement

- ❑ Transverse cracking (shrinkage) is a predominant mode of failure for VDOTs cement-based FDR sections

## Mitigation Approaches

- ❑ Can the potential for shrinkage be evaluated during design?
- ❑ Can micro-cracking and/or fog sealing be used to mitigate?

## Mix Design

- **Develop a test method to assess shrinkage**
  - Possible submission to AASHTO as a standard
  - Followed ASTM standards for shrinkage cracking
- **Assess use of #10 screenings (secondary testing)**
  - Consider with 450 psi strength ceiling

## Materials properties testing

- **Compressive strength vs modulus of rupture**
  - Relationships exist for concrete but not FDR

## Mix Design

- ASTM C78: Modulus of Rupture

## Mix Design

- ASTM 469: Static Modulus of Elasticity

## Mix Design

- ASTM 469: Static Modulus of Elasticity

## Mix Design

### □ ASTM C157: Length Change

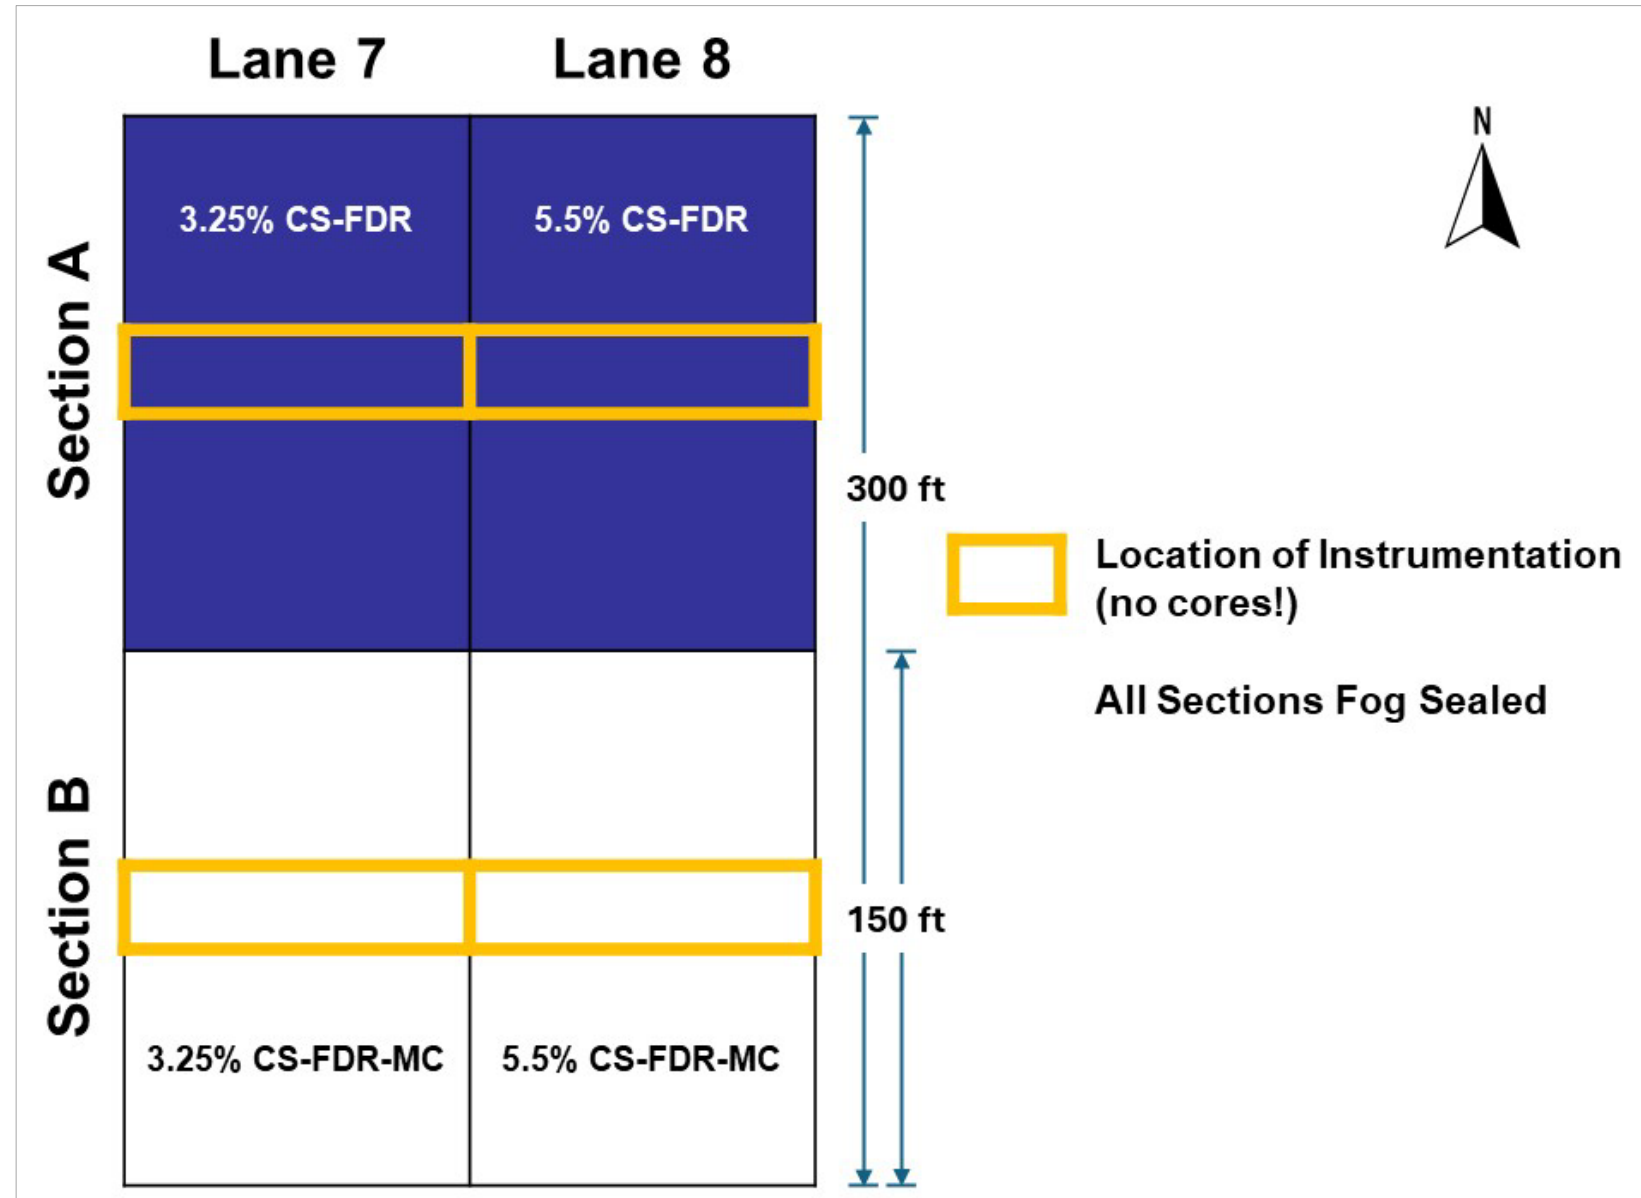

## Mix Design

- ASTM C157: Length Change

# Experimental Design

SM 9.5A 2-in
FDR-PC 8-in
VDOT 21B 9-in
Compacted Subgrade CBR = 7.5
VDOT 21B
Natural Soil

## **FDR Construction**

- ☐ Monitor Proctor, gradation, and thickness
- ☐ Instrument 2 cells per lane with sensors

## **After FDR Construction**

- ☐ Microcrack half of Lanes 7 and 8
- ☐ Fog seal all lanes
- ☐ Collect cores after construction
- ☐ Time between FDR and asphalt (2 weeks)

## Rounds I & II

# HVS Testing – Crack Survey

# Forensic Study – Trenching & Coring

□ 12-inch-deep trenches

# Forensic Study – Trenching & Coring

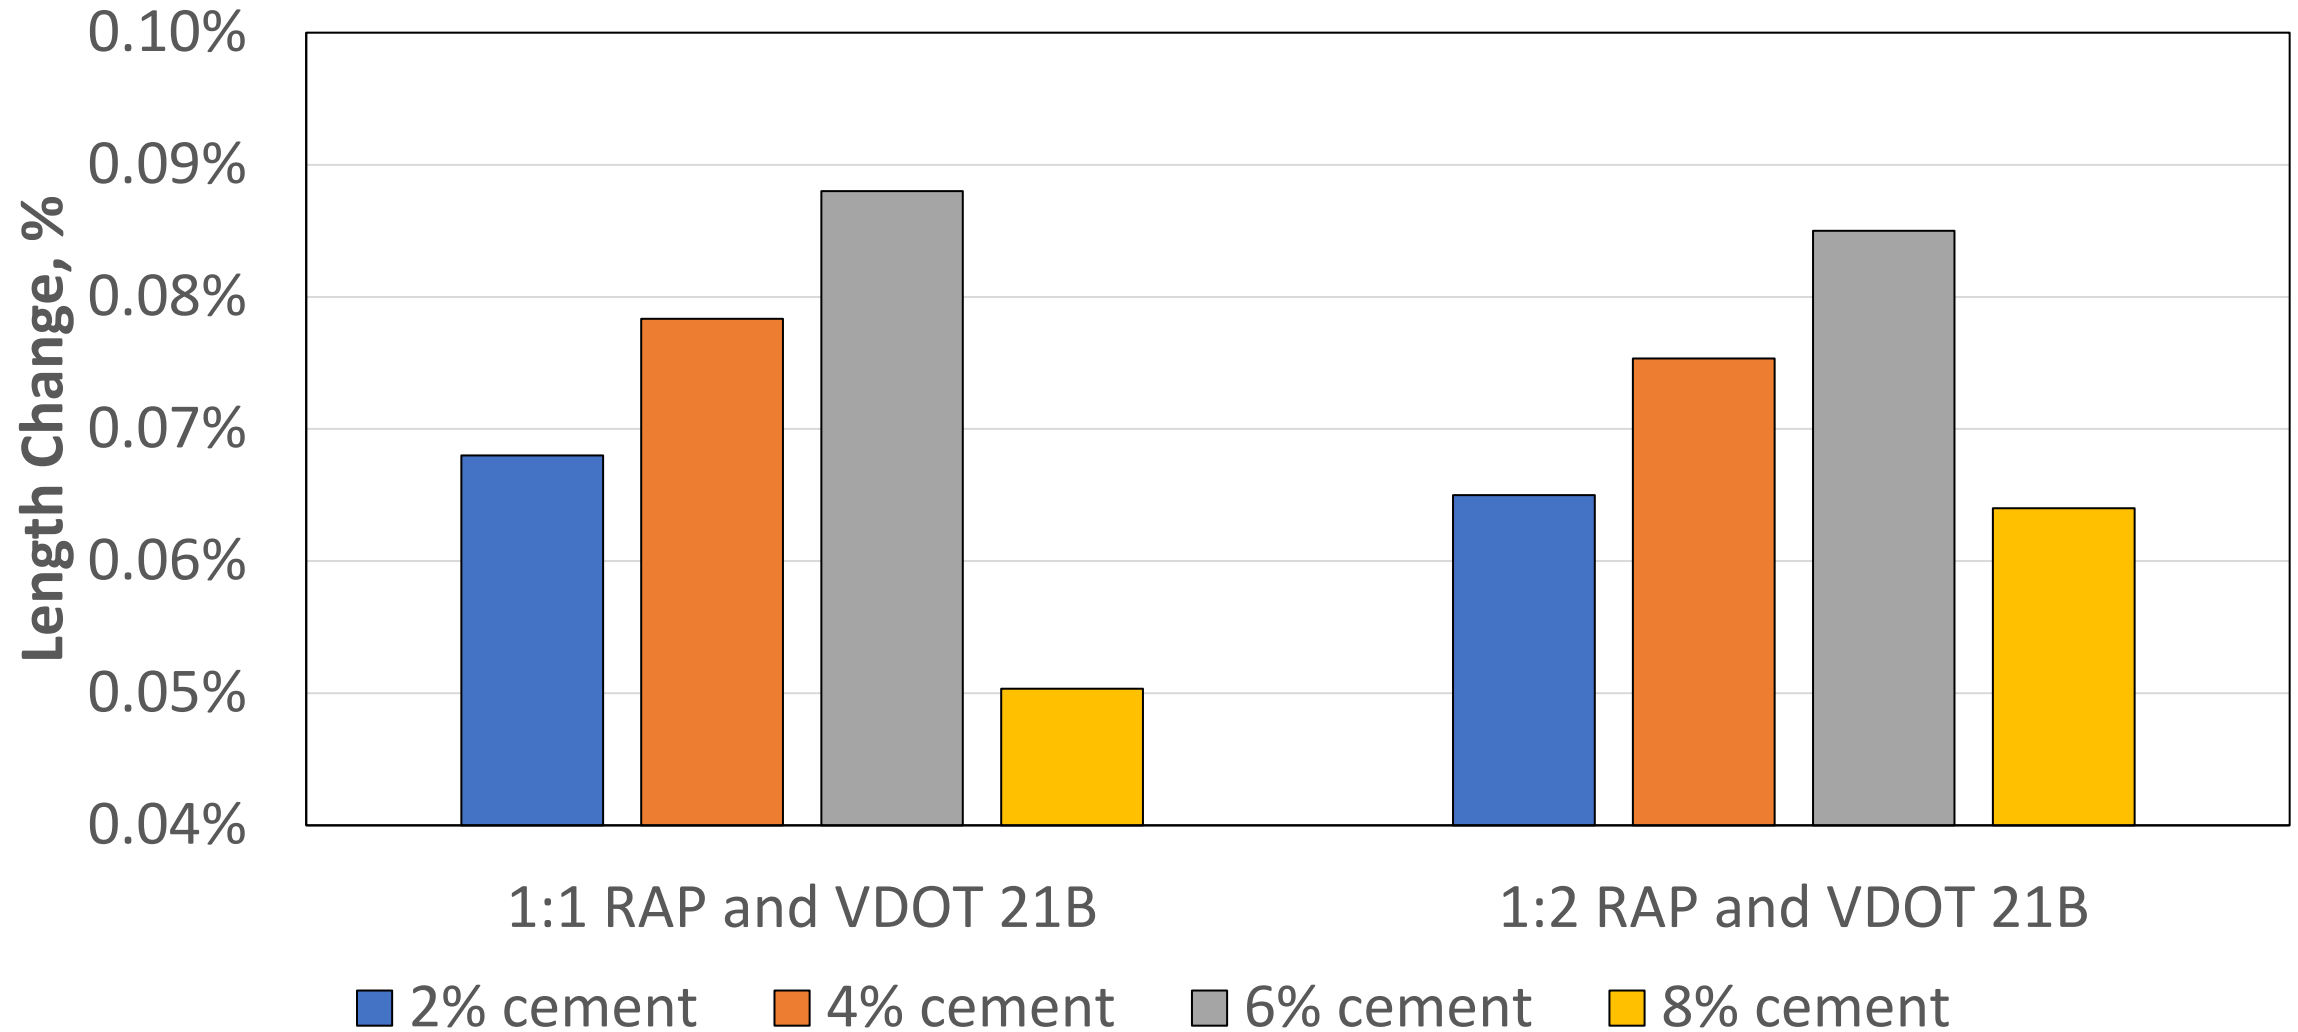

# Results – Mix Design

# Results – Mix Design (Shrinkage?)

# Results – Mix Design

## Compressive Strength vs Modulus of Elasticity | Rupture

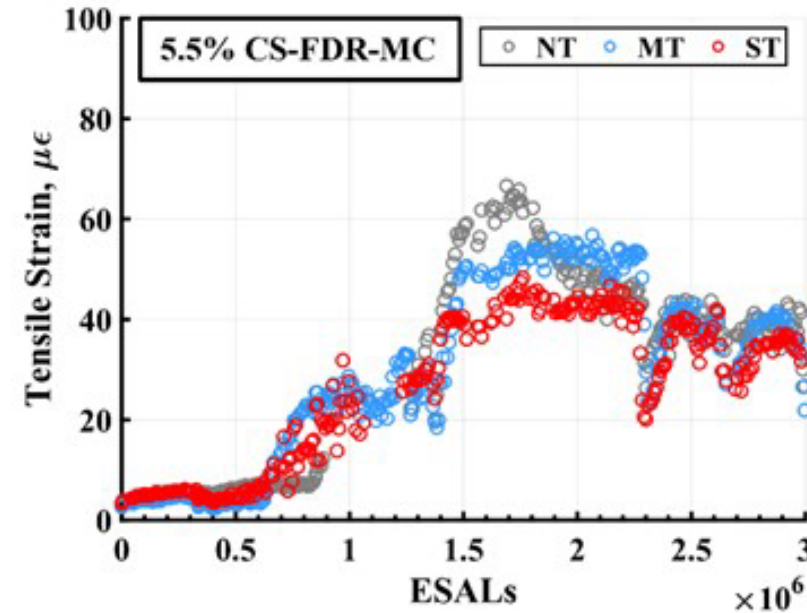

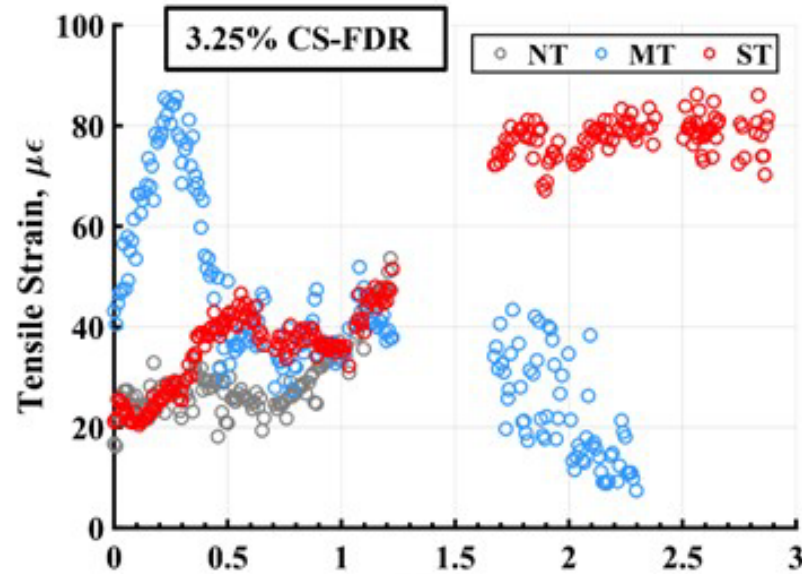

# Results – Correlations b/n Strength Tests »»»

- Good correlation b/n UCS and E, MoR
- Not good b/n length change and other tests

# Results – Tensile Strains (AC Layer)

**Note:**  
**T = Top-FDR**

**N = North Gauge**  
**M = Middle Gauge**  
**S = South Gauge**

# Results – Tensile Strains (AC Layer)

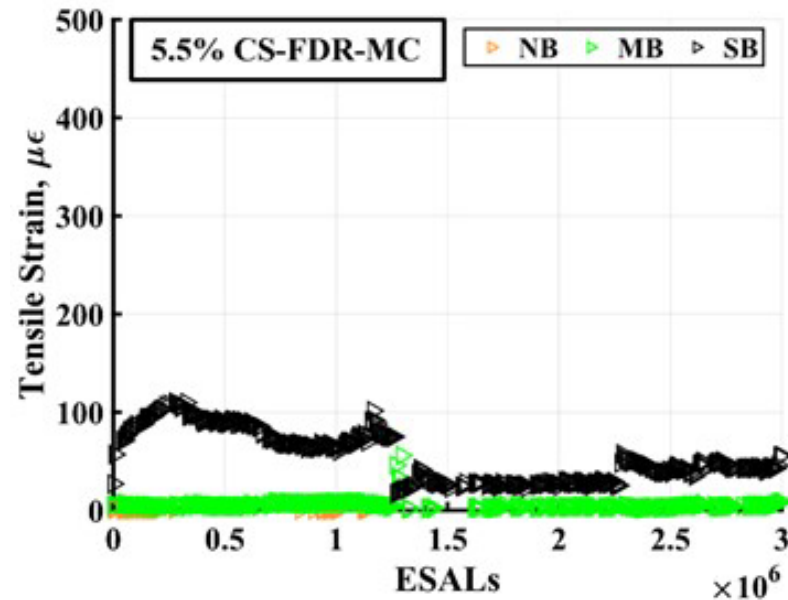

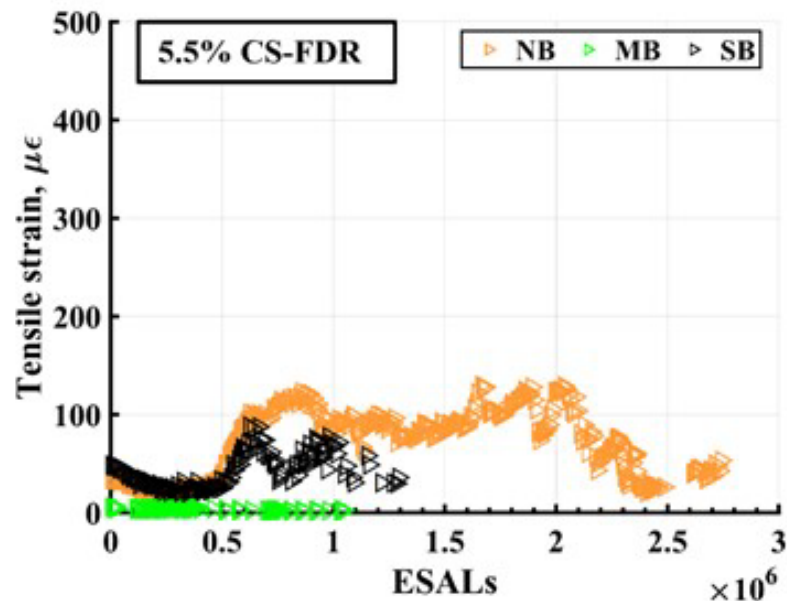

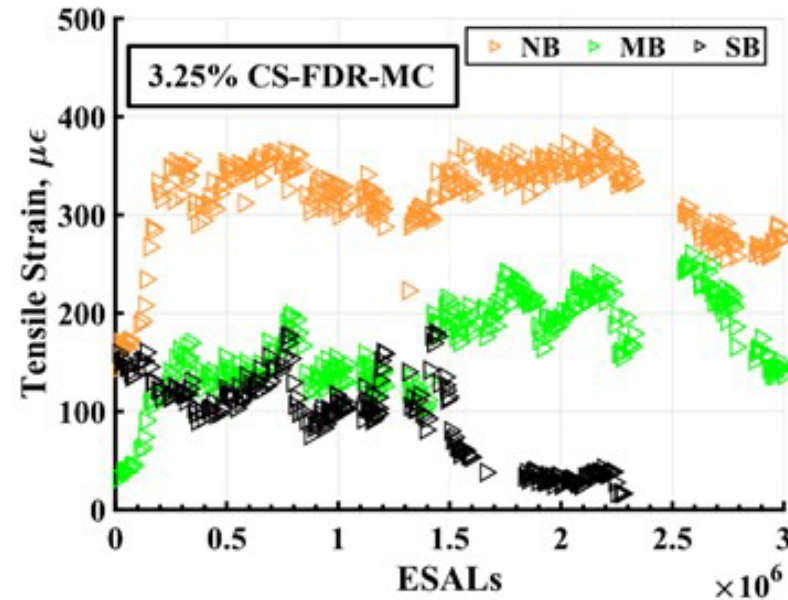

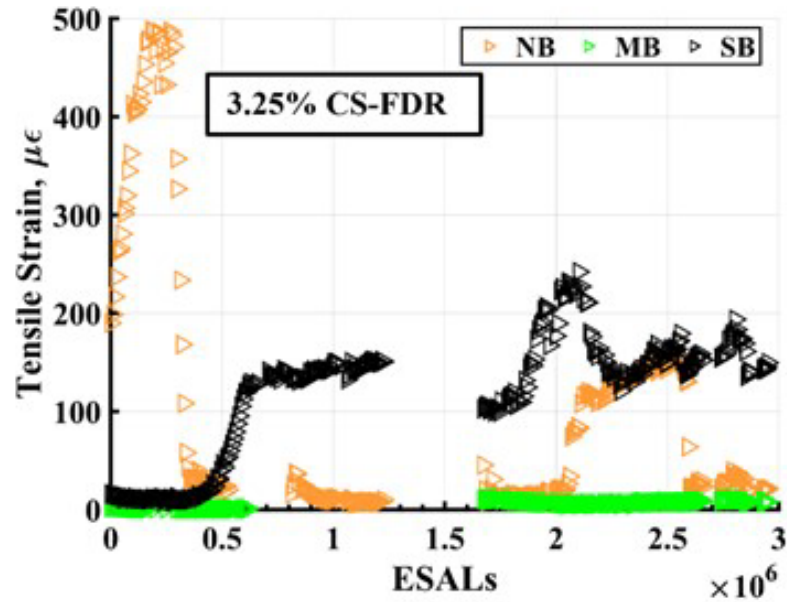

Test Section	$\epsilon_{AC}$ initial	$\epsilon_{AC}$ peak	$\Delta\epsilon_{AC}$ %
3.25% CS-FDR	21.1	86.2	307.7
3.25% CS-FDR-MC	<b>26.3</b>	<b>77.9</b>	<b>196.0</b>
5.5% CS-FDR	4.5	51.8	1060.3
5.5% CS-FDR-MC	3.1	52.9	1587.4

□ mean tensile strains higher for lower cement contents

□ % change in strains lower in lower cement contents

# Results – Tensile Strains (FDR Layer)

**Note:**

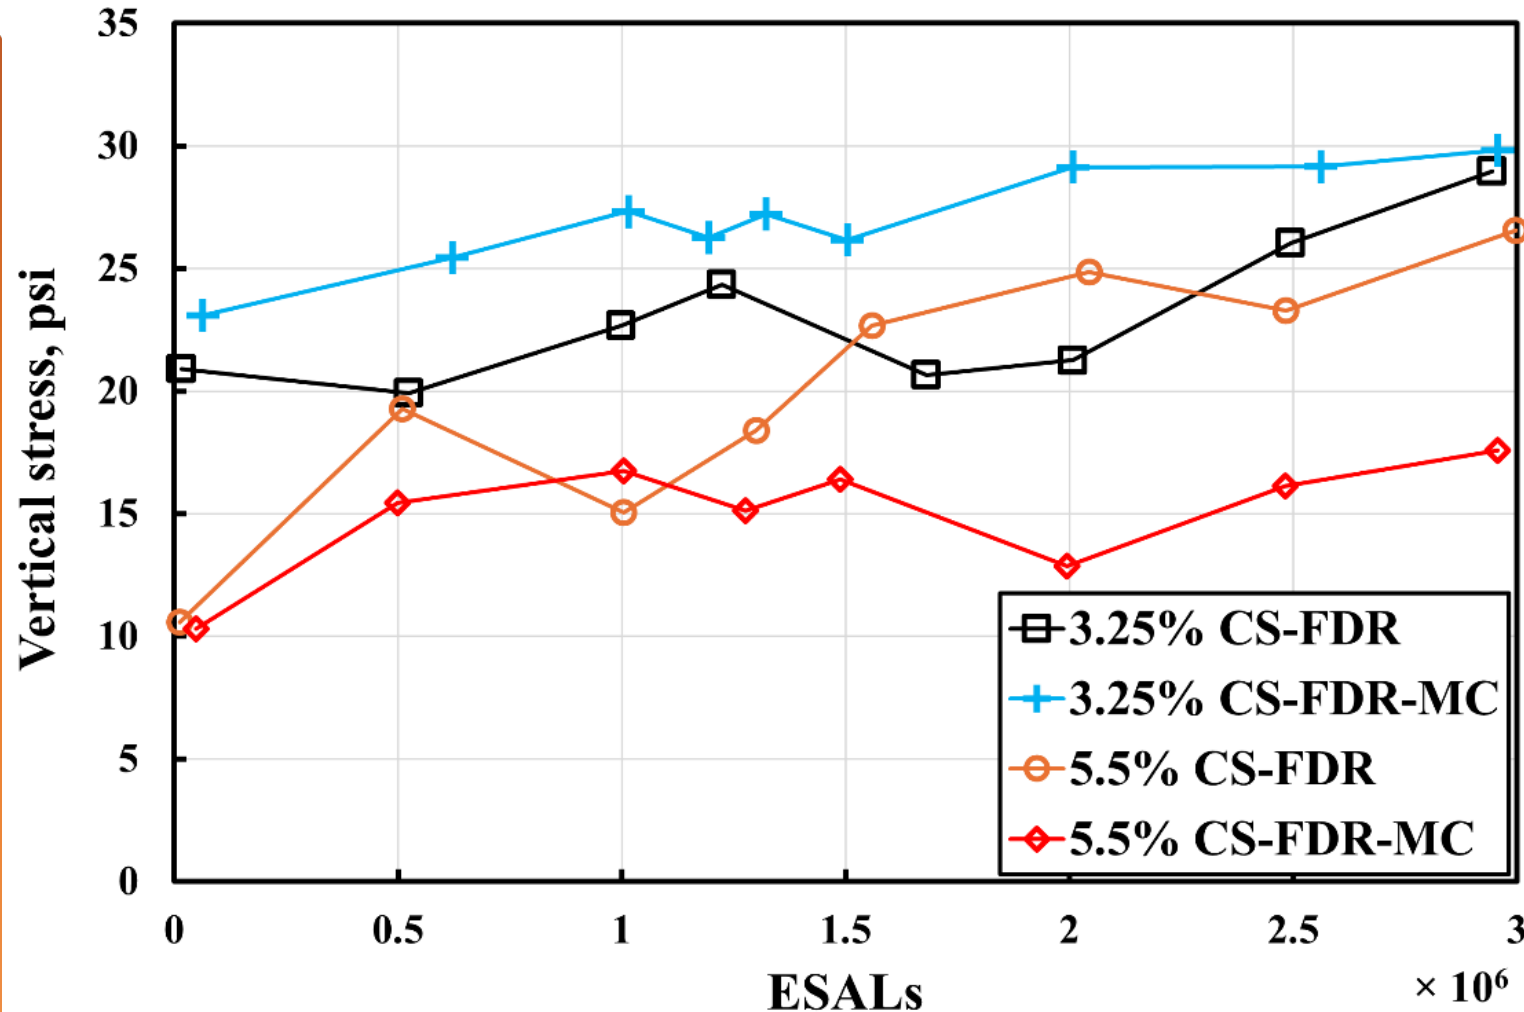

**B = Bottom-FDR**

**N = North Gauge**

**M = Middle Gauge**

**S = South Gauge**

# Results – Vertical Stress (Below FDR Layer)»»»

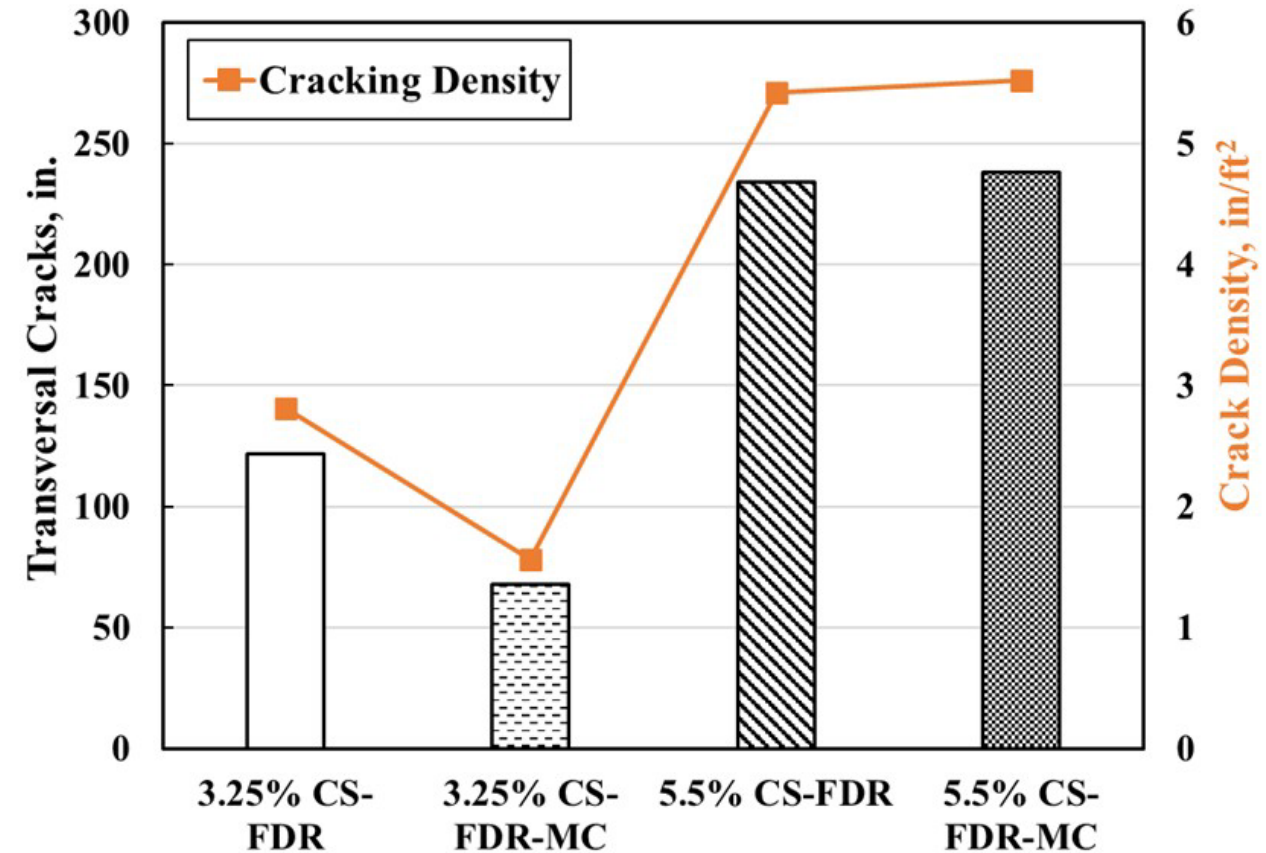

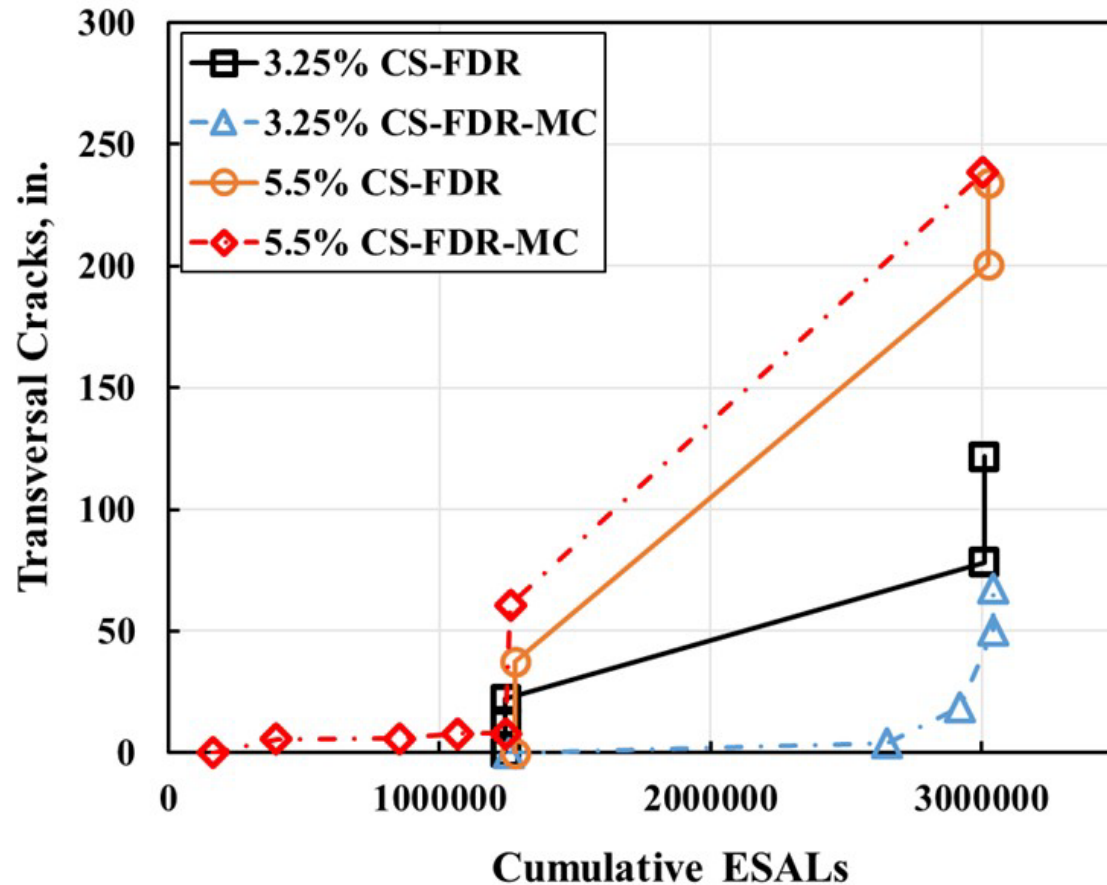

Higher stresses in lower cement content sections

# Results – Vertical Stress (Below FDR Layer) >>>

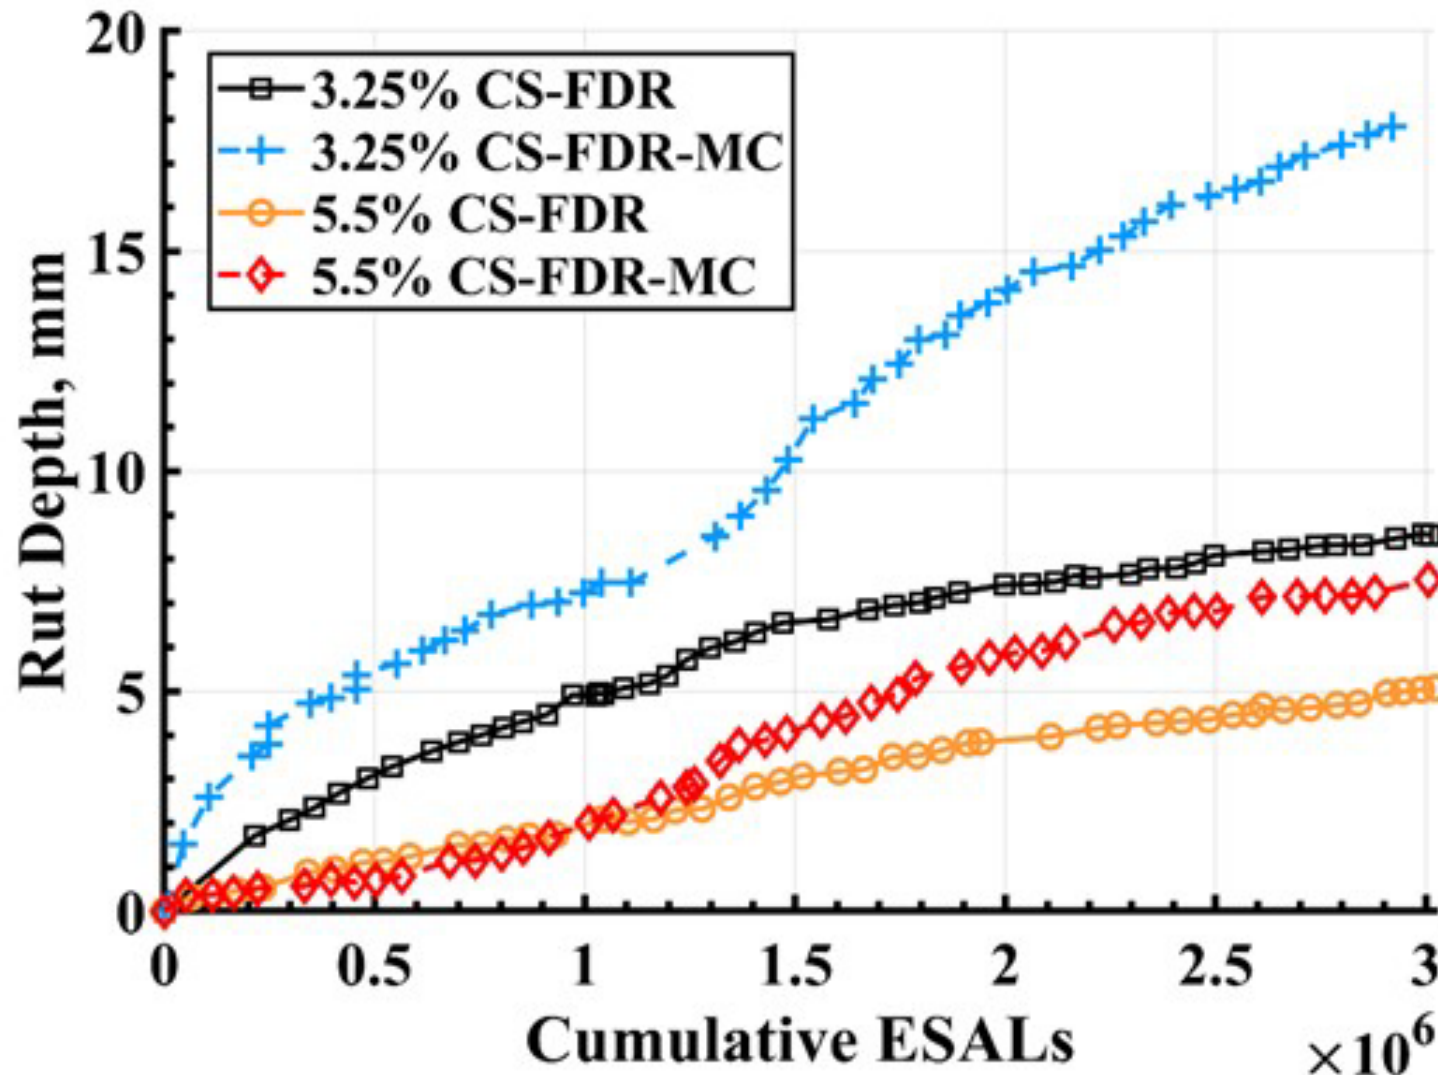

Test Cell	Stress <sub>end</sub> (psi)	ΔStress (%)	Σ <sub>avg</sub> (psi)	COV <sub>avg</sub> (%)
3.25% CS-FDR	29.0	38.5	1.9	8.3
3.25% CS-FDR-MC	29.8	<b>29.2</b>	8.1	29.5
5.5% CS-FDR	26.6	151.2	3.7	22.3
5.5% CS-FDR-MC	17.6	<b>70.7</b>	5.3	34.5

# HVS Testing – Surface Cracking Trends » » »

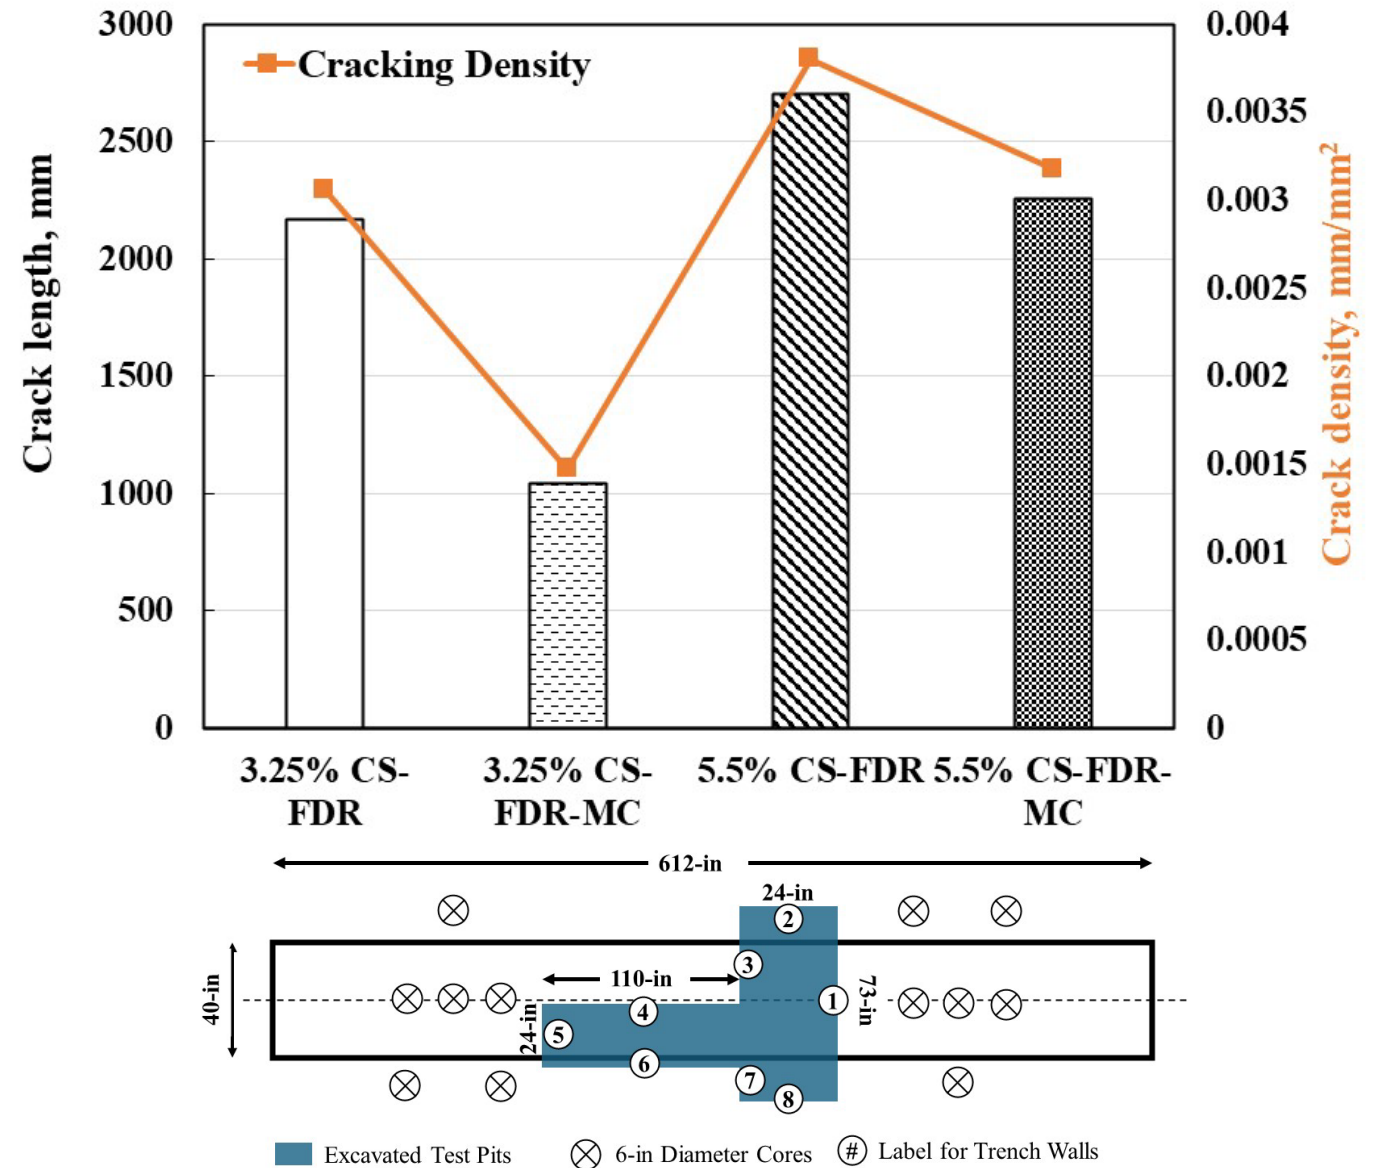

# HVS Testing – Rutting Trends

Test Cell	Median Rut depth, mm
3.25% CS-FDR	8.6
3.25% CS-FDR-MC	17.8
5.5% CS-FDR	5.1
5.5% CS-FDR-MC	7.5

- Increased rut depths in
  - lower cement contents
  - microcracked sections

# Forensic Results – Crack Evaluation

# Forensic Results – Evaluation of Cores

L7A: 3.25%  
CS-FDR

(a)

L8A: 5.5% CS-  
FDR

(b)

L7B: 3.25%  
CS-DFR-MC

L8B: 5.5% CS-  
FDR-MC

■ Excavated Test Pits    ⊗ 6-in Diameter Cores    (#) Label for Trench Walls

- Lower AC layer thickness in unloaded areas
- Similar FDR layer thickness except **thinner for 3.25% CS-FDR-MC-L section**

# Design vs Field FDR Stiffness

- Reduced stiffness observed in MC sections at both cement contents at day 49
- MC vs non-MC stiffness at day 70 were similar

- **UCS test** results correlated well with **elasticity test** and **flexural strength** test for FDR materials.
- **Microcracked** cells showed **reduced peak tensile strain** and **tensile strain changes** (at low cement) and **reduced vertical stress changes** across **both cement levels**
- **Microcracked** cells showed **fewer surface and FDR-layer cracks** but **greater rutting at low cement contents**
- The **reduction of stiffness** at early ages from microcracking is mostly or **fully recovered** at later ages

- Further Laboratory Evaluations
  - alternatives to evaluate stiffness of FDR materials
  - evaluating optimal water content and length change at different cement contents
- Exploring other methods to evaluate effectiveness of microcracking on FDR materials in lab and field
  - x-ray scanner
- Evaluating the impact of fog-sealing in FDR applications
